

Summer 2020

A message to our valued customers, partners, and community members:

Given the strain on organizations to remain functional during this time of uncertainty, PathoSans is here to support you. We are doing everything possible to help you operate safely and sustainably to ensure the health and well-being of your employees, constituents, and community. Please know that:

1. **PathoSans® Technologies USA is always open.** Designated an essential business, we continue to:
 - a. Increase production capacity for on-site-generators (OSG) and hire employees
 - b. Always ship new OSG and supply orders the same day, whenever possible
 - c. Introduce new application equipment such as the FogJet® line of misting carts
2. **PathoCide® is an effective disinfectant.** The active ingredient in PathoCide is hypochlorous acid, at a concentration of .018%. PathoCide has proven effective against a wide range of bacteria and viruses, including Norovirus, which is widely known as one of the most difficult to kill. See this [link](#) for all our efficacy data and rest assured PathoCide is an essential disinfectant for a clean workplace.
3. **PathoSans service and site support are available every day.** Our team is located throughout the US. We are local and can work with you on-site to address your unique cleaning needs. Because our OSGs have IoT capabilities, we also preventatively service systems and monitor performance, so you don't have to.
4. **Using PathoSans equipment mitigates risk.** Increased toxic chemical use increases the risk of adverse reactions. PathoSans solutions are gentle on people—non-irritating to eyes and skin, free of added fragrances and other additives. In addition to reducing health risks, PathoSans OSG gives you complete control of your supply of cleaners and disinfectants. When things get bad, you won't be scrambling for critical cleaning supplies and paying inflated prices. That is real risk reduction.
5. **Protect your employees and business by adopting the GBAC protocol.** The Global Biorisk Advisory Council (GBAC) protocol stresses the importance of forensic cleaning to remove biofilm before professional sanitizing and disinfecting. PathoClean® and PathoCide are essential tools to reducing bacterial and viral loads at your facility. They work well together and are gentle on people.

We are here to serve you and together we will get through this.

William J. Kohley, PhD
President, PathoSans Technologies USA
